

# **Delivery of Essential Medicines by Drones in Hilly areas.**

**Batch - 1**

**Group 4 (G4).**

**Team :** Gaurav Patil (A-33)  
Hrugved Kolhe (A-35)  
Rohit Chitte (A-51)  
Atharva Deolalikar (A-27)

# Problem Description

Throughout the developed and developing world, access to life-saving and critical health products are hampered by what is known as the last-mile problem - the inability to deliver needed medicine/blood from a city to rural or remote locations because of inadequate transportation, communication or supply chain infrastructure.

To solve this connectivity problem, a national drone delivery system needs to be created to carry urgent medicines to patients in need in Hilly and inaccessible areas. The team needs to build a drone that can deliver essential medical products/blood of up to 2.0 kilograms per flight while maintaining the cold chain if needed - in an average fulfillment time of 30 minutes. Also, it should be usable in emergencies, and disaster prone areas.

# Advantages

01

## Life saver

Provide humanitarian aid to areas affected by natural disasters and emergencies.

02

## Efficiency

leading to a quicker, more efficient response time.

03

## Payload

Can deliver up to the payload of 2 kilograms

04

## Avoid natural calamities

Drone Delivery is unaffected by natural calamities like earthquakes.

# Advantages

05

## Inexpensive

Inexpensive compared to other modes of transportation.

06

## No need of human

Less Human Intervention in the complete process of delivery

07

## Can deliver anywhere

Delivery is not confined to specific geographic locations.

08

## Can deliver anything

The provisions include medical supplies, antivenom and blood products.

# Disadvantages

01

## Collection of data

Drone collects the data values like altitude, speed, location through GPS.

02

## Less accurate

The mathematical distance and value needs to match the actual values for better accuracy

03

## Can be dislocated

A network of semi-autonomous systems in a hilly region can dislocate the drone and can lose control over it.

04

## Turbulence

Harsh climatic conditions can cause turbulence and drone may lose control .

# Challenges

## **Lack of data**

Lack of real-world data from autonomous navigation system implementation.

## **Network Issue**

Network issue in a hilly area.

## **Damage to drones**

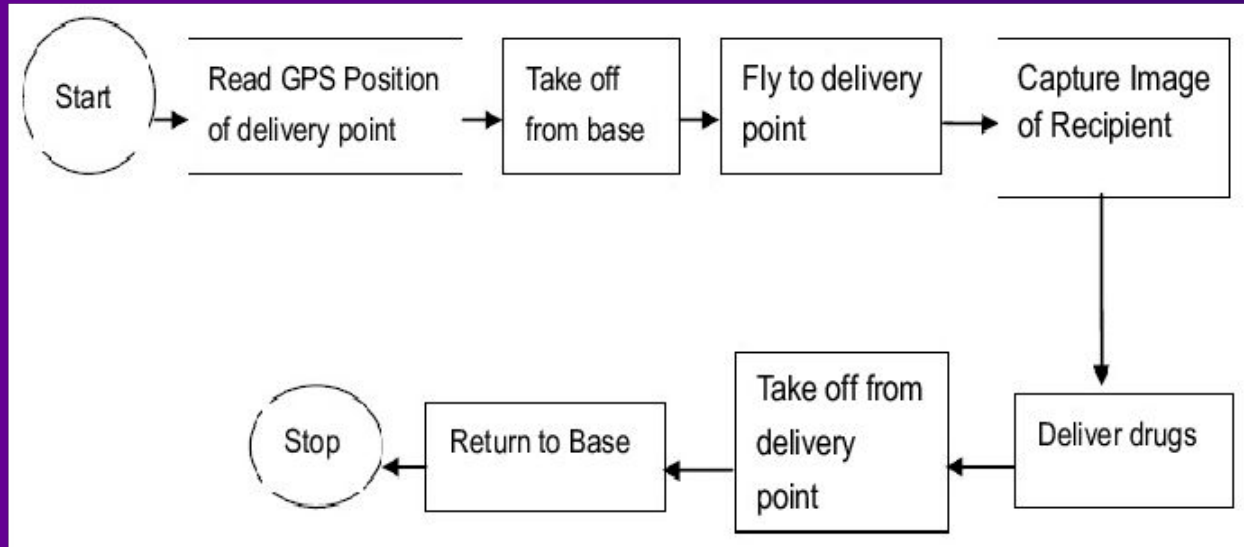

High winds in hilly areas can cause damage to drones

## **Maintenance**

Fueling for long-distance travel. Integration of hardware and software

- BLDC motor (4 Nos.)
- ESC (4 Nos.)
- Propeller(4 Nos.)
- Flight controller with components
- Quad X frame
- foxtech Generator
- Fuel tank
- Generator with components
- Peltier & Thermostat
- Cooling fan
- Temperature controlled box

The background is a solid purple color. Overlaid on this are several white, wavy, concentric lines that form a large, abstract shape in the center. These lines are closely spaced and follow a similar path, creating a sense of depth and movement. The overall effect is a modern, minimalist design.

**Thank You**
